GFS. by GRES

What GFS is

GFS makes projects fundable, transparent and accountable.

- Our clients are purpose and ESG projects. Our partners are the people and institutions that fund and foster them.
- We connect funders, projects and payments: capital is locked and released milestone by milestone, only when delivery is proven and signed.
- The platform, and the blockchain beneath it, are instruments of transparency, efficiency and trust, not the product and not a crypto experience. There is no crypto friction.

The problem

Across the projects we serve, capital is committed but release is manual and opaque, proof is scattered, and trust depends on intermediaries. Two costs follow:

- Bureaucracy: in philanthropy alone, 20% to 35% of funds typically go to administration, overhead and fundraising before reaching the purpose.
- Absence of verifiable trust: donors and funders cannot be sure their money reaches who needs it, or that anyone is accountable.
- The scale is large and the sector recognizes the need for better instruments: **4.3 billion** people gave money, time or help in 2023 (CAF World Giving Index 2024); CAF alone moved over £1bn to charities in 119 countries, a fifth of it across borders. The report's own recommendation to the sector is good governance and transparency of impact to build public trust. That is what GFS provides.

The market

- Global philanthropy moves around US$1.3 trillion a year in money and donated time, and the sector is estimated to hold close to US$1.5 trillion in managed assets, reaching up to 5% of world GDP.
- Roughly 10 million NGOs operate worldwide; 92% run on US$1M a year or less, the first wave GFS serves free.

How it works

- Funders deposit into a vault.
- The project is mapped as a tree of milestones, each with terms, required evidence and validators.
- On save, the rules become an automated release schedule.
- Funds are released only when delivery is proven and signed to consensus.
- A single release can split across many recipients, anywhere in the world.
- Everything is recorded and can be audited.

Designed protocols

A designed protocol is the tailored rulebook we build with each partner for a specific project.

- It defines the milestones, terms, required evidence, validators, release logic and splits for that project's reality.
- The platform is the engine; the designed protocol is how it is applied to a concrete purpose or ESG project.
- It is shaped to each project (by the client) and its funders, then runs transparently from end to end.

Status and roadmap

- Today: MVP, in active build, pre-revenue.
- Origin: GRES Protocol, a perpetual AI-Augmented real estate fund, was the starting point; building it, we found the engine itself useful beyond real estate.
- Roadmap: **Now**, the GFS platform. **Next**, GRES Protocol, the inclusive fund. **Then**, on-chain financial services for holders. **Later**, a data layer, the Global Real Estate Standard.

Traction to date

- **As GRES Protocol:** contracts deployed and verified on BASE with a Gnosis Safe multisig (verifiable on Basescan); Whitepaper and Communication Charts published; gres.network live; brand, channels and community in place.
- **As the GFS platform:** navigable product prototype of the vau and milestone engine; product backlog scoped at 93 stories across 18 epics; for the first pilot we are looking into NGOs, builders and accelerators that could not only test and validat the product but also collaborate with us.

Business model

- Platform and transaction fees on vaults and milestone releas
- Float earned on custodial balances held before disbursemen projects.
- Design and origination fees on the protocols we shape for partners.
- Management and performance fees on the GRES Protocol fu spreads on on-chain financial services; data and API licensir

Team

- Founder, Thiago Sequinel: engineer, two prior exits, currently Operations and Marketing Director at Autobiz Iberia (Stellant Group).
- Actively recruiting team members and partners (technical, legal, business development).

The raise

Pre-seed: €150,000 for 8% of GRES (post-money valuation about €1.875M).

Use of funds, 6 months cash run: MVP platform engineering smart-contract and custody integration on BASE; design and UX; first live pilots (an NGO and one partner); legal and company setup.

KPIs

- **Bureaucracy removed (cost-to-purpose):** share of funds reaching the destination; admin and overhead avoided per project, against the 20% to 35% sector norm.
- **Trust through transparency and governance:** 91% of donor give more when confident in an organization's transparency (Charity Navigator). KPIs: percentage of funds traceable; percentage of releases with validated proof; independent custody plus a validation quorum.
- **Volume that feeds our revenue:** total volume processed (GMV); average custodial balance held before disbursement (float base); average holding period until release; take rate o fees (fees ÷ GMV).
- **Once live:** purpose projects funded; global contributors per project; funds released against verified milestones; time-to-release.
